their Functions, also called motherboard, is the primary component in computer.. Acute hepatitis of non-A, non-B (NANB) type.

----- NANB-type acute hepatitis is characterized by: 1) a history of recent travel to endemic areas (particularly Asia, Africa, and South America); 2) a recent contact with an infected person; 3) severe hepatitis, with an important mortality rate. These infections are usually due to infection with GB virus A (GBV-A), a gammaretrovirus (phylogenetically related to ALV, FeLV, CELV, and HTLV-1) that can be isolated in over 90% of cases. Clinical forms

----- NANB-type acute hepatitis is generally considered as the most severe form of

hepatitis. It has a tendency to rapidly progress to liver failure. The incidence of fulminant hepatic failure is approximately 10%. Hepatitis E is a self-limiting, water-borne acute illness, most often seen in young adults. Clinical presentations are heterogeneous, ranging from subclinical to acute hepatitis. Aging and immunity ----- All viruses are susceptible to cellular immunity and the risk of severe disease is generally greater in children, who have less developed immune
