Game server A game server (also game server or game host, dedicated game server, game host, dedicated game host or server) is an Internet computer resource providing various game server functions, such as game hosting and online gaming. A game server allows online gaming between a game client and a game server, without the game client having to be connected to the Internet or to any other server of the game. A game server may also be called an e-gaming server, virtual server, dedicated server, private server, or gaming server. It may or may not host other gaming functions, such as gambling and online betting. For a game server to provide online gaming, a game client (also referred to as a player computer or a player system) must be connected to it. Game clients are clients that connect to a game server. For example, a player computer can be a client for an online multiplayer game. Game servers are frequently used to host game servers, in which a smaller game server is connected to a larger game server. The smaller game server is referred to as a server farm. Depending on the game, a game server may provide network or player-to-player online gaming, as well as game hosting. The most common game server is the World Wide Web. Other commonly used game servers include dedicated servers and game servers for fantasy and sports games.
