Software applications such as AutoCAD Serial Key are considered to be one of the important tools of modern architects. Along with the help of AutoCAD, architects are able to design and draft various construction projects. AutoCAD can perform a wide range of functions including creating 2D floor plans, 3D drawings, generating 2D architectural visualization, modeling, and creating animations. AutoCAD is one of the most popular CAD programs for architects and engineers. It has been studied at the university level, has a thriving online community, and is in the process of being added to the list of technology standards for construction project management. This free introductory lesson will help you to learn the basics of AutoCAD. You will learn how to start a new project, how to create an architectural drawing, how to add a section to your drawing, how to change the dimensions of a part, how to change the style of a part, and how to create a drawing. For each part of this lesson, we will start by looking at the step-by-step instructions in a video lesson, then move to a text explanation, and finally, to a walk-through of the software. With the help of this lesson, you will be able to understand: How to start a new drawing. How to create and open a new drawing. How to create a section. How to add dimensions. How to change the dimensions. How to change the style. How to add annotations. How to save your drawing. How to perform drawings at a later time. 1. You can start a new drawing by pressing the Enter key on your keyboard and choosing File > New or choosing a drop-down menu option. You will be prompted to choose the file type that you wish to use as your new drawing. You can also choose "Project" to create a project. Q: How to connect to SQL Server database with docker and containerized python environment? I have a SQL Server database running on a Windows Server 2019 machine. I want to run a Python script to read and write data to the database. The Python script is running in a docker container on a Linux Ubuntu 18.04 machine. I can use the python -m psql --quiet command to access the database remotely but I don't know how to configure the connection string so that I can access it from inside the container? I've tried using host=localhost, host=10.0.0.23 and host=10.0.0.23,port=1433 and host=10.0.0.23,port=1433,user=postgres and host=10.0.0.23,port=1433,host=postgres but I get psql: FATAL: role "postgres" does not exist psql: FATAL: role "postgres" does not exist psql: FATAL: role "postgres" does not exist psql: FATAL: role "postgres" does not exist psql: FATAL: role "postgres" does not exist psql: FATAL: role "postgres" does not exist I've read through the psql documentation and it seems to indicate that the only options are --quiet and --username but I can't figure out how to specify the connection string so that it works with the docker containerized environment. I've also tried -H 10.0.0.23 -H 10.0.0.23,port=1433 but no luck. I expect the connection string will be something like -H host=10.0.0.23 -P port=1433 -U username -D database_name Can you please advise? A: Finally figured it out by searching for python and psql. Turns out I can just specify the connection string when I run the script using an env variable by prepending it with an env variable. Specifically I just run: export MYSQL_DATABASE=databasename export MYSQL_USER=username export MYSQL_PASSWORD=password export MYSQL_HOST a1d647c40b
